

Seed / config / tags

A failing random test is useless if you cannot replay it

What belongs on the card

- Seed fixes the RNG so stimulus can return
- Config holds plusargs and knobs, test name, baud, modes, not seed alone
- Tags label slices: smoke, nightly, flake, quarantine
- Weak means you recorded a seed but not enough config to relaunch
- Missing any field blocks a clean replay story

INTERACTIVE TOOL

Seed / config / tags

Document-aid literacy: attach **seed**, **config**, and **tags** so a failing run is replayable and triageable. Starter: complete metadata card — **REPLAYABLE**.

Starter example: seed 42, config +UVM_TESTNAME=uart_byte +BAUD=115200, tags smoke,nightly — card **REPLAYABLE**.

Quiz: seed: A fixed seed is recorded so that...

☐ the same RNG path can be replayed when debugging a fail

☐ synthesis area shrinks

☐ coverage is ignored

☐ Makefile PHONY works

Core ideas

seed

Fixed RNG seed for exact replay.

config

Plusargs / knobs that select the run.

tags

smoke / nightly / flake for triage.

REPLAYABLE

All three present with a strong config.

Lab

SCENARIO

Lab starter

Planning docs practice

- Write one run card for an imaginary fail: seed, two plusargs, and two tags
- Then rewrite a bad card that only says “seed seven” and explain why a teammate could not

Pitfalls to watch

- Do not file fails with seed only
- Do not skip tags so flakes vanish from boards
- Do not change knobs while claiming the same seed replay
- And do not treat the literacy board as your company's database

Your turn

- Complete the checklist for at least one track, preferably both
- Build one replayable run card, then take the quiz and continue to regression triage
