

CI / farm flow

Verification scales in stages

Local, CI, farm

- Local is fast sanity before push
- CI is the agent gate, pull request or nightly slice
- Farm is where long regressions and stress live
- Pass advances; fail blocks; open means not run; skip gaps the chain
- A green farm with a failed local or skipped CI is not an honest ready flow

INTERACTIVE TOOL

CI / farm regression flow

Document-aid literacy: stage regressions through **local** → **CI** → **farm** (sanity → gate → scale). Starter: all three stages pass — flow READY.

Starter example: local → ci → farm all **pass** — flow READY.

Load starter example

Challenges 0 / 22 cleared

Quiz: local: The local stage is for...

☐ fast developer sanity / smoke before pushing

☐ only farm-scale soak

☐ replacing the scoreboard

☐ synthesis area reports

Core ideas

local

Laptop sanity / smoke before push.

CI

PR gate or scheduled nightly slice.

farm

Scale-out full / stress regression.

READY

All three pass — chain complete.

Lab starter

learn_verification_planning_management — ci farm flow

Planning docs practice

- Draw three boxes, local, CI, farm, and write what runs in each for your team
- Mark yesterday's real or fictional status pass, fail, open, or skip
- If any is fail or skip, write the promotion rule you would enforce

Pitfalls to watch

- Do not skip CI because the farm is “more complete.” Do not ignore local reds
- Do not treat one green farm night as a full flow
- And do not forget that seed and triage habits feed every stage

Your turn

- Complete the checklist for at least one track, preferably both
- Describe or set a clean local-to-farm chain, then take the quiz and continue to sign-off
