

Sign-off checklist

Sign-off is a gate, not a vibe

Met, open, fail, waived

- Met means evidence exists
- Open means not demonstrated yet
- Fail means the criterion is broken, such as a sev-one still open, and the gate is blocked
- Waived means a written exception with owner

INTERACTIVE TOOL

Sign-off criteria

Document-aid literacy: exit criteria for **coverage**, **bug bar**, and **stability** (plus optional waiver). Starter: all three met — gate READY.

Starter example: coverage_goal, bug_bar, and stability_window all **met** — gate READY.

Load starter example

Challenges 0 / 22 cleared

Quiz: coverage: Coverage exit criteria usually mean...

☐ agreed cover / requirement goals met with no open P0 holes

☐ a Makefile PHONY target

☐ only lint clean

☐ VCD file size under 1 MB

Core ideas

coverage

Plan % / P0 holes closed for the gate.

bug bar

No open sev-1 / blockers against the DUT.

stability

Green window / flake bar held.

READY

All met or waived — no open, no fail.

Lab

SCENARIO

Lab starter

learn_verification_planning_management — signoff checklist

Planning docs practice

- Write three exit criteria for a milestone
- For each, note what evidence you would attach and who owns a waiver if needed
- If any criterion is fail, write what would unblock the gate

Pitfalls to watch

- Do not silent-skip failed criteria
- Do not waive without owner, reason, and expiry
- Do not sign off on coverage percent alone while sev-ones remain
- And do not confuse this literacy checklist with your company's legal release process

Your turn

- Complete the checklist for at least one track, preferably both
- Walk one gate to ready or name what blocks it
