

Planning path complete

You now have a working map of verification planning and management

Skills you can reuse

- Write plans others can audit
- Prefer measurable coverage claims over test-name lists
- Mix test tiers on purpose
- Close holes with next-test ideas
- Prioritize by risk and impact
- File fails with seed, config, and tags

Dual-track recap

- If you mainly used browser boards
- If you mainly wrote docs, revisit any planning lab for graded challenges
- Either way, keep the vocabulary shared with your team

Where to go next

- Return to UART, SPI, or I²C to attach plans to protocol work
- Deepen UVM and pyuvm when you need stronger TB engines
- Use HDL simulator, Icarus, or Verilator courses when execution fidelity is the bottleneck
- Climb the syllabus ladder for the gap you feel most

Mindset to keep

- Plans without coverage claims are theater
- Coverage without closure actions stalls
- Metrics without triage lie
- Sign-off without evidence is hope
- Small, maintained artifacts beat giant unread spreadsheets

Closing

- Check off the wrap checklist
- You finished the verification planning and management path
- Pick one real project artifact to improve this week
